

Web SSO with Cloud Resources using AD Federation Services

Thursday, 11 April 2013 16:15 (15 minutes)

Summary

We are currently using ADFS with SAML 2.0 for several projects to enable web SSO. In using ADFS we have found that we can federate with other institutions, service providers, and federations. We will demonstrate use cases for each of these configurations including an example using Azure. This allows institutions to federate on their own with other institutions and cloud providers giving users pass-through or SSO authentication to access external resources.

Presenter: FLANDERS, Dean

Session Classification: Federated Identity Management Workshop
