

# Prod network update

- APEL team has been asked to test the network
  - Replies received already
- We should include more users in following updates (i.e. SAM)
- Discussion: Do people think there is sufficient time to ask from more clients to test things for the pending update in November?
- Can SAM team perform testing and report back in time?

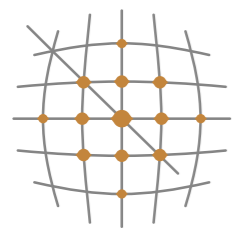

# Logging of unauthenticated clients

- Logging mechanism developed and tested on prod brokers
  - Logs are verbose but the source IP is being written
- Next step: Include changes in conf package and rebuilt
- Gather unauthenticated client IPs in end-October and thereafter periodically every 2 weeks
- Once clients have been identified we will follow up on them by opening GGUS tickets

# Failover mechanisms

- Started development on testing whether it is possible for clients to use the network of brokers in a failover way (i.e. whenever one broker is unhealthy the client should be aware to move on and contact another broker in the network)
- So far it seems doable but further development and testing of this feature is required
