

## VO procedures and requirements

SA1 & NA3

G. Borges

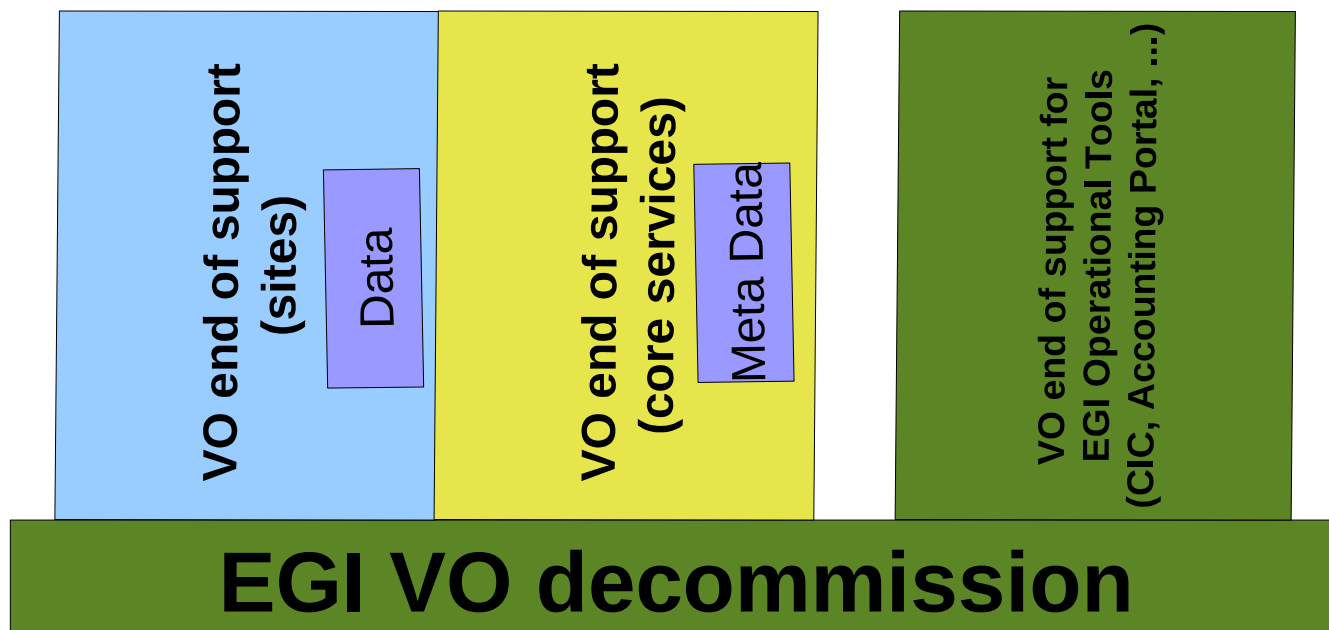

IBERGRID

1. Ticket assigned to NA3 VO Services Support Unit
  - [https://gus.fzk.de/ws/ticket\\_info.php?ticket=63564](https://gus.fzk.de/ws/ticket_info.php?ticket=63564)
2. Request from the VO manager to change the VO name
  - VO manager wishes to migrate data without having to use the “*download to scratch and upload*” method.
  - Current middleware does not support VO renaming:
    - bypassing authentications / authorizations mechanisms
    - modifications of ACLs in SEs and Data Catalogues (deployed under several technologies)
3. Propose to close the ticket as “unsolved” but...
  - one has to state what have we learned with this request...

1. Is it plausible to ask for a mechanism for VO renaming?
  - There are active VOs which do not follow the VO DNS name style...
  
2. Dimitris Proposal:
  - Narrow the requirement to include a mechanism permitting a user with multi VO membership to move his data around VOs he is member of.
  - For LFC and DPM it would mean some not so difficult SQL queries, but of course there should be many other factors (and problems...)

1. Independently of setting up (or not) a requirement, it is clear that EGI also need:
  1. VO end of support procedure (for several components)
  2. EGI VO decommission procedure

1. There is a request which SA1 can not manage
  - Should it become a requirement to EMI?
  - If yes, we should properly formulate it.
  
2. EGI is missing...
  - A end of support procedure at site / service level
    - How to proceed if a site wishes to drop the support for a given VO?
    - How to deal with the data stored at the site?
    - How to migrate metadata?
  - A VO decommission procedure at the infrastructure level
    - What to do to clean up EGI tools?
    - What to do with the VO accounting data?
