

Evolution of the EGI authentication and authorization infrastructure

Wednesday, 21 May 2014 16:40 (15 minutes)

A federated authentication and authorization infrastructure, in order to enable transparent access to multiple e-infrastructures, requires to harmonize the authentication solutions used by the users, and to provide tools for attribute management to be used for the authorization process.

This session collects contributions from user communities, resource providers and technology providers about their requirements of and experiences on AAI, plus a discussion segment.

Wider impact and conclusions
