

Training on Data Preservation

Thursday, 22 May 2014 14:00 (1h 30m)

Digital encoding has become the dominant way in which we create, shape and exchange information. Digital Preservation is an emerging field for research and development and needs reflection in education and training. This session provides training customised to the needs of research communities in the following technical areas:

- o data management planning;
- o trusted archives, audit and certification;
- o meta-data packing of representational information for preservation;
- o value generation through data re-use;
- o business models for data preservation.

Training will be provided by the Network of Excellence APARSEN - Alliance Permanent Access for the Records of Science in Europe Network, whose mission is to help to train the next generation of digital preservation experts by designing different types of curricula.

Wider impact and conclusions
