Installation and configuration of dCache

Wednesday, 13 April 2011 11:00 (45 minutes)

Description of the work

EMI will deliver a consolidated and streamlined set of services and components from ARC, gLite, UNICORE and dCache by re-factoring existing components, defining and implementing standards and phasing out duplicate or obsolete components from the original middleware stacks. The middleware components are divided in four areas (Compute, Data, Security, Infrastructure). This tutorial will focus on the cutting edge EMI solutions for Data Management, dCache and STORM.

A tutorial on the installation and configuration of this components will be provided.
Access to virtual machines will be given,
allowing participants to perform installations by themselves.

Conclusions

Based on production-proof solutions deployed in large scale infrastructures, EMI offers a wide range of solutions that can be adapted to tailor infrastructures according to different needs. Future work will address their interoperability and standard adoptions, that will potentially extend the base of supported communities.

Overview

EMI aims to deliver a consolidated set of middleware components for deployment in Distributed Computing Infrastructures, extending the interoperability between grids and other computing infrastructures, strengthening the reliability of the services, and establish a sustainable model to maintain and evolve the middleware, fulfilling the requirements of user communities. EMI middleware will be not build from ground, but based on existing solutions, that will be enhanced by standards adoption and

mutual interoperability. This workshop is an opportunity for resource providers to be introduced with main features of EMI-1 release, to have an overview of EMI-1 related changes and its Data and Computing solutions.

Impact

The participants will get a concrete overview of EMI-1 solutions for Data management; participants will be thus able to reproduce installation, configuration and basic usage of deployed services.
