

OIDC-Agent - OIDC for the commandline

Thursday, 30 November 2017 17:10 (10 minutes)

OIDC-Agent is a tool to simplify OpenID Connect (OIDC) token management on the commandline. It was designed to manage OIDC tokens and make them easily usable. We followed the ssh-agent design, so users can handle OIDC tokens in a similar way as they do with ssh keys.

Multiple account configurations may be loaded in oidc-agent concurrently. oidc-add is also used to remove a loaded configuration from OIDC-Agent.

OIDC-Agent may be started in the beginning of a login session. Through use of environment variables the agent can be located and OIDC access tokens are available on the whole system.

Full documentation can be found at
<https://indigo-dc.gitbooks.io/oidc-agent/>.

Topic Area

Security, trust and identity

Type of abstract

Presentation (15 minutes)

Primary authors: WEGH, Bas (KIT-G); Mr ZACHMANN, Gabriel (KIT); HARDT, Marcus (KIT-G); STEVANOVIC, Uros (KIT-G)

Presenter: STEVANOVIC, Uros (KIT-G)

Session Classification: Security, trust and identity management
