NGI-CH national infrastructure operational tools

The SMSGC Grid Monitor is used by the Swiss Multi Science Grid to actively and passively monitor its ARC infrastructure. The monitor consolidates data from the ARC information system, from Nagios, from the SGAS accounting system, and from site functional tests into a single portal, which provides personalized access to users, site administrators and VO/Grid administrators.

the poster will present the technical details of the SMSGC Grid Monitor and how it could be integrated as part of the EGI infrastructure.
