

ACLs in Message Broker Network

Christos Triantafyllidis <ctria@grid.auth.gr>

- Use unauthenticated connections
 - We don't really know who is using the service
 - We cannot limit access to the approved applications
 - Messages could be lost if consumed by wrong client

- No need to change things in one step!
- Clients could move to authenticated connections using x509 or username/password combination
- We can provide sample code if needed
 - Currently test it with SAM needs
- When all (known) clients migrate, we can switch the network to authenticated only

- Accept authenticated connections as a requirement for all clients that are using the broker network
- Add a request to all clients to provide us their topic/queue access list
 - Which topic/queues they are using
 - Who should read and who should write on them

Thank you

- Find me for more info if need during the week
