

IBERGRID roadmap towards expanding capacities and capabilities for scientific service provisioning

Monday, 2 November 2020 15:55 (25 minutes)

For the past 12 years IBERGRID has been the forum for common activities and sharing of knowledge between Spain and Portugal in the area of distributed computing. IBERGRID federates infrastructures from Iberian research and academic organizations mainly focused on Grid, Cloud computing and Data processing. As such it enables the joint participation of Spain and Portugal in international initiatives of distributed computing such as the EGI Federation, and Data Repositories in the framework of EOSC.

IBERGRID also provides regional operations coordination for the computing and data processing activities of several international user communities including ESFRIs. In this presentation we will present the challenges ahead regarding service development & deployment, and co-development activities with research communities of Iberian interest.

Presenter: CAMPOS, Isabel (CSIC)

Session Classification: Highlights from EGI participants and partners - Part 2
