Running containers in advanced computing environments with udocker

Thursday, 21 October 2021 11:40 (15 minutes)

udocker is a tool to enable execution of Linux containers in user space. Distinctively from other tools, udocker is meant for easy deployment, and provides multiple execution engines to cope with different host environments. udocker does not require privileges and can execute containers with or without Linux namespaces making it suitable to execute containers across a wide range of Linux computing environments such as HPC resources.

Presenter: GOMES, Jorge (LIP)
